

For this exercise I am trying to play a specific genre of music on Pandora.

Answers to the 7 questions given in lecture:

Step 1: Search for music

1. I went to the Pandora website and was presented with a text box asking me to type in a particular artist or music genre. The intent of this seems pretty obvious to me. I type in a genre and hit enter
2. There is really only one action here. That is to enter in a search term and hit enter
3. There is mapping in the intent of the developer to have me enter a search and hit enter.
4. To preform the action: hit enter or there is also a button
5. The state of the site changes to reflect my input
6. I'm presented with a list of choices
7. I can see lists of musical genres to know if I am in the right place

Step 2: List of genres

1. I am given a list of musical genres to pick from. With the intent that I click on the one that I want.
2. Some actions here are that I can choose a station to play or I can choose another search term.
3. The lists of stations are highlighted so that they look like links and want to be clicked
4. To preform the action I click on one of the stations that has a description similar to what I wanted to see.
5. Once clicked the page changes to a station based on the link that I clicked.
6. The station starts playing
7. Since it's playing right away I know immediately if I'm in the right place.

The task of finding a specific station on Pandora was pretty simple. I've never used Pandora before but I went from going to their website to playing a very specific genre of music in under 30 seconds. I think it would be very difficult to find a place for them to improve on that short of them actually reading my mind and knowing what I wanted to hear ahead of time.
